

Good Molecules

AI visibility remediation, prepared by Blackwell Enterprises. June 2026.

This letter sets out the work Blackwell Enterprises would do for Good Molecules and the terms. Good Molecules currently blocks AI assistants from reading its site, so the work reopens that channel and makes the product data readable to AI while classic Google Search stays as healthy as it is today.

What's Included

1. **AI crawler access.** Reconfigure the AWS WAF to allow the AI retrieval and grounding crawlers (OAI-SearchBot, ChatGPT-User, PerplexityBot, Perplexity-User, Claude-User, Claude-SearchBot, Google-Extended), move training-crawler controls to robots.txt, and verify each with a reachability test.
2. **Machine-readable product pages.** Add server-side Product and Offer structured data, so an AI reader gets the price, size, ingredients, availability, and the shipping and returns policy without running JavaScript.
3. **Schema correction.** Fix the markup to the canonical Product and AggregateRating types and the https schema.org context, and add OpenGraph and product meta tags, so strict and AI parsers accept the data Google already reads.
4. **AI guide files.** Publish llms.txt, llms-full.txt, and agents.md with brand-written product and policy context, giving assistants a clean source the brand controls.
5. **Before-and-after measurement.** Benchmark AI crawler reachability, schema validation, and the brand's citation rate across ChatGPT, Perplexity, Gemini, Google, and Claude, at kickoff and at delivery.

An AI Assistant Pilot

EXPLORATORY · NO ADDITIONAL COST

Rather than logging into a dashboard, the team would text the assistant to add a product, change a price, update stock, or check an order, and it makes the change on the live site. Blackwell would build it with Good Molecules as a design partner during the engagement at no additional cost, with no effect on the work above or the fee.

Team

Armaan Priyadarshan (Dartmouth, Mathematics and Computer Science), Samarjit Deshmukh (Dartmouth, Computer Science), Ethan Zhou (UC Berkeley M.E.T., EECS and Business), and Shamit D'Souza (Stanford, Computer Science and Biology).

Timeline

Blackwell completes the work within two weeks, starting within three business days of signing. Good Molecules reviews the changes near the end of week one, and Blackwell delivers the WAF configuration, the structured data, the schema corrections, and the guide files, and re-runs the benchmarks, by the end of week two.

Price

\$1,000

The total fee for the work above, paid in full upfront. If the work does not meet the agreed benchmarks, the full fee is refunded. The fee includes two rounds of revisions. Third-party WAF, CDN, or hosting charges on Good Molecules' own systems are not included, and are paid directly or billed at cost.

Ownership, Privacy, and Cancelling

Once paid in full, Good Molecules owns the deliverables, including the schema, the guide files, the WAF configuration, and the benchmark report. Blackwell keeps Good Molecules' information confidential and may name it as a client. Either side may stop with seven days written notice.
