

Atlas Skateboarding Website Visibility Audit

How Atlas shows up in Google and AI today, what it quietly costs the shop, and the fast fixes that change it.

PREPARED FOR	DATE	SCOPE	CONTACT
Atlas Skateboarding leadership	June 16, 2026	Public site, search and AI surface, paid readiness	ethanpzhou@berkeley.edu

EXECUTIVE SUMMARY

An elite shop with broken findability plumbing

Atlas is one of the Bay Area's most respected skate shops, a San Mateo institution and art gallery open since 2007. Its website does not tell Google, or any AI, that story. The five issues below are fast, mechanical fixes, not a rebuild, and they are the same gaps we found on DLX last week, here at nearly double the scale: 4,528 products with no machine-readable data behind them.

F

29 / 100

ATLAS TODAY

Low for an encouraging reason. The cause is surface-level configuration the current setup never turned on, not a broken foundation. The catalog, the brand, and the 19-year heritage are A-grade. The plumbing that exposes them to Google and AI is off. That is days of work, not months. CCS, Tactics, and Labor, the benchmark set, sit well above this on every technical row.

DIMENSION	ATLAS	SCORE	WHAT IT MEASURES
On-page SEO	24		Title tags, meta descriptions, headings, canonical hygiene
Structured data	8		Product / Offer / Organization / LocalBusiness schema, rich-result eligibility
Brand & entity	28		Machine-readable identity, name disambiguation, brand story
AI / GEO readiness	33		llms.txt content map, agent-readable catalog, AI shopping presence
Content & merchandising	52		Catalog depth, blog activity, how well assets are leveraged
Composite	29		Grade F. Every finding below is externally verifiable with public tools.

THE FINDINGS, WORST FIRST

Five fixes, mostly mechanical

CRITICAL 1. The homepage does not say what Atlas is

The title tag, the line Google weighs most, is the one word "Atlas." The meta description is empty, there is no h1, and the share image is declared over insecure `http://`. You rank for "Atlas," one of the most contested words on the web, and little else. "Skate shop San Mateo" and "Antihero decks near me" never surface you.

`<title>Atlas</title>` · meta description: empty · h1 tags: 0 · og:image over `http://`

Fix. Descriptive title, meta, and h1 templates across homepage, collections, and products, plus an https share image. Theme-level, measured in hours.

CRITICAL 2. 4,528 products carry no structured data

No product page renders any JSON-LD, the format Google uses for rich results (price, stock, stars) and the format AI shopping engines read to recommend and compare. The data sits in Shopify; it is never exposed. So your listings are plain blue links, and when a shopper asks ChatGPT or Google AI "where can I buy X," Atlas cannot be quoted. CCS, Tactics, and Labor expose all of it.

Product / Offer / AggregateRating schema on a product page: none

Fix. Emit Product + Offer schema (price, availability, SKU, brand) across the catalog from data Shopify already holds. One template, all 4,528 products covered.

HIGH 3. No machine-readable identity, and "Atlas" is ambiguous

There is no Organization or LocalBusiness schema, so search and AI do not know Atlas is a physical San Mateo shop and gallery open since 2007. The about page tells the story ("driven by passion over profit"); no machine can read it. "What is Atlas / is Atlas legit / Atlas hours" get a guess or silence.

Homepage JSON-LD blocks: 0 (no entity, no LocalBusiness, no store info)

Fix. Organization + LocalBusiness schema (location, hours, socials), a short homepage brand block, and entity groundwork so "Atlas" resolves to the shop.

HIGH 4. The AI-commerce layer is switched on but empty

Shopify auto-provisions `llms.txt`, `agents.md`, a working UCP/MCP endpoint, and an agentic-discovery sitemap. Atlas has all of it, but the `llms.txt` is the generic 4.4 KB Shopify boilerplate, not a content map. To an agent reading it today, Atlas is an anonymous Shopify store, not the Bay Area shop with one of the deepest Antihero and independent-brand selections.

`llms.txt` = default "Agent Instructions" template, ~4.4 KB, zero brand or curation content

Fix. Rewrite `llms.txt` and `agents.md` as a real content map (brands, categories, the San Mateo store and gallery), keeping the working transaction layer underneath.

MEDIUM 5. Real assets, badly under-leveraged

Atlas has assets most shops would envy: 4,528 products, 106 collections, and roughly 990 posts across three blogs (news, projects, videos), including collaboration features with Alien Workshop, Lakai, Stussy, and Antihero. The blog carries no Article schema and is not wired into SEO, and the catalog churns by hand.

Fix. Article schema and SEO wiring on the blog archive now. Later, and only if it is worth it, scope automating the catalog busywork (new-arrival onboarding, restock and drop alerts), after we understand how you run things.

Before the Meta ads, get the plumbing ready

You want help with traffic, including Meta ads, beyond SEO and GEO. The fixes above are what make paid pay off, and the Meta measurement plumbing is not connected yet, so spend today would fly partly blind.

Google Ads (AW-841187191) and GA4 (G-3PF1CHM497) are live, with Klaviyo and Attentive connected. But no Meta pixel fires on the storefront; Shopify's customer-events config shows the Meta app slot present with its system-user token empty, so neither the browser pixel nor the Conversions API is sending events. Tactics, by contrast, runs a live Meta pixel. Advantage+ and dynamic product ads, the formats that make Meta efficient for a 4,500-product catalog, also run on a clean product feed, which is the same structured data finding 2 is missing. Fix the catalog once and you feed Google Shopping, AI shopping, and Meta together.

LAYER PAID SPEND DEPENDS ON	STATUS	NOTE
Meta pixel + Conversions API	Not connected	App slot present, system-user token empty; no events reaching Meta
Product catalog feed (Advantage+)	Blocked	Depends on the structured product data missing in finding 2
Landing & collection pages	Weak	Thin titles and empty meta; fixed by finding 1
Measurement (GA4) and Google Ads	Live	Already running; benefit from the same clean feed

Sequence. Land the findability and schema fixes first, connect the Meta pixel and Conversions API alongside them, then turn on Advantage+ against the clean feed. We cannot see your ad accounts or ROAS from outside; this is the on-site plumbing paid depends on, which is what is verifiable here.

What the leaders already do

Three of the most visible skate retailers online, on the same machine-readable signals. This is not about catalog or credibility; Atlas competes on those. It is about the plumbing.

SIGNAL	ATLAS	CCS	TACTICS	LABOR
Homepage title	"Atlas"	descriptive	descriptive	descriptive
Homepage entity schema	none	Organization · WebSite · SearchAction	Organization · WebSite · SearchAction · ContactPoint	Organization · WebSite · SearchAction
Product structured data	none	full Product + Offer	full Product + Offer + ratings	full Product + Offer + Brand
Meta description	empty	present	present	present

Atlas has the heritage and, in San Mateo, a story none of them can copy. On the machine-readable layer that decides who Google and AI surface, it is the only one of the four showing up empty. Tactics is the sharpest contrast: even after its 2025 sale and a February 2026 store closure, it keeps full schema and a live Meta pixel. The plumbing is cheap to keep.

PHASE 1 · A SMALL, LOW-RISK FIRST STEP

\$1,000

Findability and feed fix sprint

- Title, meta, and h1 templates across homepage, collections, and products
- Product + Offer structured data across all 4,528 products
- Organization + LocalBusiness entity schema for the San Mateo store and gallery, plus a brand block
- llms.txt and agents.md rewritten as a content map; Article schema on the blog archive
- Meta pixel and Conversions API connected, product catalog feed prepared for Advantage+
- Benchmarks set together: rich-result coverage, schema-validator pass rate, search and AI visibility, Meta event match quality, before and after

\$1,000 upfront, refunded in full if the benchmarks are not met. Automating the catalog busywork is a separate, cheap layer we would scope later, only once we understand your week.

Reproducibility. Every finding here is externally verifiable with public tools: view-source, the Schema.org validator, and the store's own robots.txt, sitemap.xml, llms.txt, and /products.json. Counts pulled from the live product and collection sitemaps on June 16, 2026; competitor signals pulled the same day.
