

Agent Commerce Readiness for Public Goods

30-day engagement preparing the storefront for AI shopping agents and the agent-to-agent commerce surface that follows.

SERVICE PROVIDER

Blackwell Enterprises

Agent commerce infrastructure for consumer DTC brands.

CLIENT

Public Goods

PublicGoods.com

BACKGROUND

AI shopping agents (ChatGPT, Perplexity, Gemini, Google AI Mode, Claude, Copilot) now mediate category discovery and brand comparison. The transactional surface is shifting toward agents executing on behalf of users, and eventually on behalf of other agents. Merchants whose catalog, pricing, and review data are not legible to agents are omitted from the consideration sets agents build. Blackwell builds the data and protocol layer that prepares merchants for this environment, today and as agent-to-agent commerce becomes the default.

ENGAGEMENT AND SCOPE

Blackwell will deliver an audit of how AI shopping agents currently see Public Goods, followed by a 30-day implementation sprint structuring catalog, pricing, and review data so agents discover, cite, recommend, and (where the protocol permits) transact with Public Goods accurately. The work spans Schema.org structured data, agent discovery surfaces (llms.txt, agents.md, agentic sitemap), the Unified Commerce Protocol (UCP), and Model Context Protocol (MCP) endpoint readiness.

- Discovery audit.** Five-dimension scoring of current AI visibility (discoverability, quotability, recommendability, transactability, reputation) with verbatim AI response evidence. Findings document delivered at engagement start.
- Catalog, pricing, and review remediation.** Per-variant offers and SKU/GTIN population in product schema. Member tier pricing as machine-readable structured data. FAQPage and Review schema across product detail pages. Resolution of policy contradictions across customer-facing pages. Custom llms.txt content map with brand context. Sitemap hygiene and noindex of deprecated content.
- Benchmark setup and verification.** Joint benchmarks set at kickoff. Re-measured at day 30 across coverage rate in ChatGPT/Perplexity/Gemini, composite AI visibility score, schema validator pass rate, and surfacing rate of deprecated content. Schema validator pass at 100% required for sign-off.

CONTINUED WORK

The 30-day engagement is Phase 1. Continued work, scoped after Phase 1 benchmarks land, covers weekly AI behavior monitoring across six platforms, entity establishment (Wikipedia, Wikidata, Knowledge Panel), AI training corpus management, competitive intelligence on agent-readable surfaces, AI shopping platform partnership development (ChatGPT Shopping, Perplexity Shop, Google AI Mode), and protocol-evolution work as UCP, AP2, and MCP standards advance.

TEAM

Armaan Priyadarshan · Dartmouth, Math and CS

Ethan Zhou · UC Berkeley, MET (EECS and Business)

Samarjit Deshmukh · Dartmouth, Computer Science

Shamit D'Souza · Stanford, CS and Biology

TERM AND FEE

\$1,000 USD

All-in for the 30-day engagement. Audit, implementation, benchmark setup, verification. Payable on delivery of the verification report at day 30. Kickoff within five business days of execution.

CONFIDENTIALITY, OWNERSHIP, TERMINATION

All deliverables become Public Goods's property on payment. Blackwell will not disclose Client-specific findings or data without written consent, and may reference the engagement as a customer relationship (brand name, work category, public benchmark deltas) for portfolio purposes. Either party may terminate with seven days written notice; if Public Goods terminates after audit delivery, a \$400 audit-portion fee is due, otherwise no fee is owed.
